

# Amicus HT High Temperature Air Source Heat Pumps

- Heating capacity ranging from 7.7 to 100.7kW
- Suitable for LTHW and DHW applications
- Low Noise Levels
- Operates at up to 63°C water temperature
- COP up to 4.64
- SCOP up to 4.20
- Scroll Compressors Equipped with “Economised Vapour Injection”
- Integral controls including:
  - BMS fault and remote on/off signal
  - Indirect water heater control / Hot Water Priority
  - Anti-Legionella programme

**Lochinvar**<sup>®</sup>  
HIGH EFFICIENCY BOILERS & WATER HEATERS

# Amicus HT

## High Temperature Air Source Heat Pumps

Amicus HT air to water Heat Pumps are an efficient method of providing low temperature hot water (LTHW), which can be used for space heating or for the generation of domestic hot water. As a renewable technology, Amicus HT works by absorbing low grade energy from surrounding air and directs this into an evaporator, which converts the liquid into a cold, low-pressure gas. This is the refrigerant in its gaseous state, which is then pressurised, heated and circulated to a heat exchanger which can then transfer this heat to the space heating or hot water system.

The Coefficient of Performance (COP) ranges from 4.16 to 4.64 across the 13-model range. These figures are based upon the EN14511 standards of 35°C water flow temperature and an ambient temperature of 7°C. Amicus HT units can operate in temperatures as low as -20°C.

All units are high temperature air to water heat pumps, which means they can supply water at temperatures of up to 63°C, making them suitable for a wide range of space heating and domestic hot water applications.

### Economised Vapour Injection (EVI)

This could also be described as two-stage compression with inter-cooling. The process begins when a proportion of the refrigerant liquid is extracted and passes through an expansion valve. The low temperature liquid/gas mixture is then injected into the heat exchanger which acts as a sub-cooler. The liquid then evaporates and the vapour produced is superheated. This process significantly boosts capacity and Heat Pumps equipped with EVI technology will usually operate more efficiently than models with single scroll compressors.

### Amicus HT Key Product Features

In addition to EVI technology other key features include:

- Low Noise Floating Frame Technology
- Condensate Management Tray for Safe Discharge
- Antifreeze Protection
- Pre-Configured User-Friendly Control System
- Flow Temperatures up to 63°C
- Staged Compressors to Enhance Load Matching
- Minimal onsite Refrigerant Volume

### Amicus HT Bivalent – ‘Integrated’ installations

An Amicus HT Air Source Heat Pump installation, integrated with Condensing Boilers and/or Water Heaters can offer additional benefits. The Amicus HT unit will act as ‘the lead’ in terms of supplying heating/hot water and the Boilers/Water Heaters will supplement during peak demand.

This maximises the benefit of the Amicus HT Renewable technology, and when compared with monovalent installations, can reduce capital cost. As a result, return on investment (payback) can often be more attractive with this ‘integrated’ approach.

Amicus HT units can be integrated with most types of Condensing Boilers and Water Heaters.

### Ancillary Options

- Anti-Vibration Dampers
- Remote Control Panel
- Electronic Soft Start
- Interface card for Modbus control
- Thermal Stores
- Pre-Plumbed Hydraulic Kit – Including Primary Circulating Pump and Safety Valve
- Cascade Control

## Installation Clearances

Amicus HT Heat pumps are designed for outdoor installation and in order to work efficiently and effectively It is vitally important that adequate air volume is available to the source fan; and it is important to provide sufficient space for clearances.

Details on specific clearances by Amicus HT model are available in our Installation, Commissioning and Maintenance manuals, which are available at [www.lochinvar.ltd.uk](http://www.lochinvar.ltd.uk)

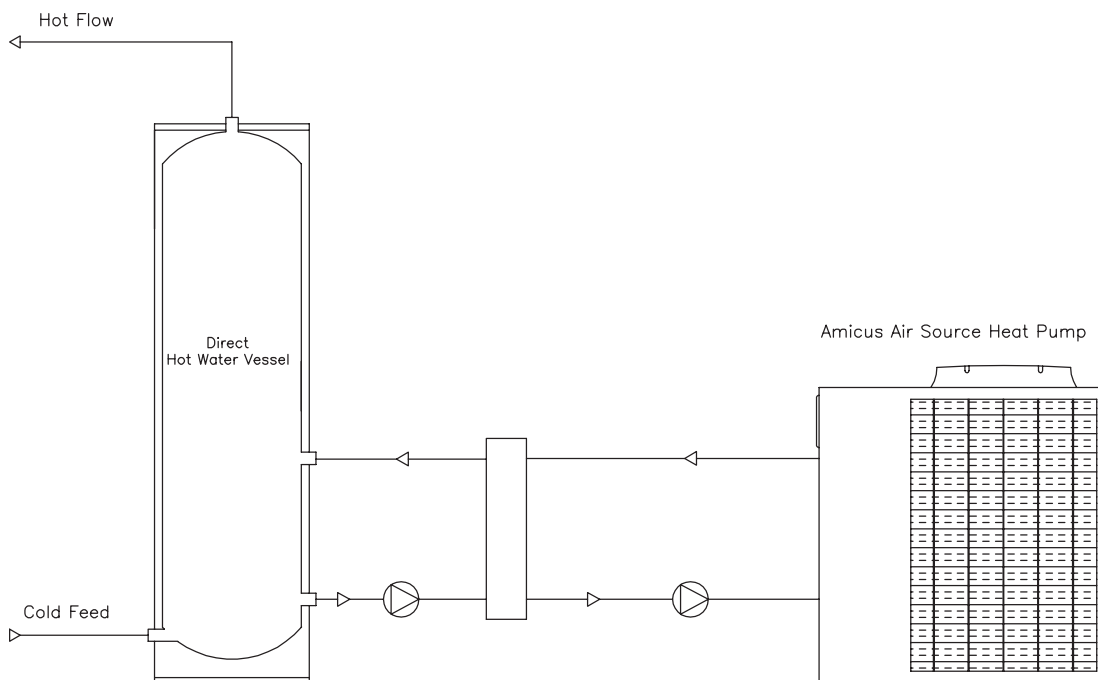

# Typical Schematic Drawings Monovalent Systems

Amicus HT EVI technology allows for operation as a monovalent system –  
i.e. a 'stand alone' Heat pump installation without the requirement for a secondary heat source

**Stand-alone Amicus HT Air Source Heat Pump providing heating only**

**Stand-alone Amicus HT Air Source Heat Pump providing hot water only**

# Typical Schematic Drawings

## Bivalent Systems

Amicus HT units installed in combination with traditional Boilers and/or Water Heaters provide an integrated renewable solution, which can reduce capital outlay and reduce payback period

**Amicus HT Air Source Heat Pump providing hybrid hot water solution, with EcoKnight gas-fired condensing water heater**

**Amicus HT Air Source Heat Pump providing a LTHW heating solution with gas-fired condensing boiler back-up - an integrated renewable solution, which can reduce capital outlay and reduce payback period**
